

Imitating Human Play from Game Logs (Workshop)

Spyros Samothrakis

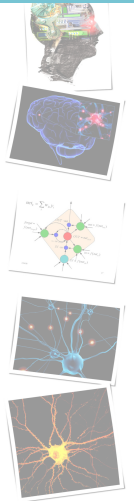

July 20, 2015

1 / 22

Imitating Human Play: A brief introduction

The workshop

2 / 22

GOALS

- Be able to explore the relevant literature independently.
- Gain enough experience in supervised learning methods in order to incorporate player behaviours in your game.
- What you will need:
 - A Laptop, almost everything tested in Mac/Linux, NOT windows
 - A working python installation
 - Clone this repo: <https://github.com/aigamedev/nuclai15>
 - Make sure you can run train.py (i.e. see which imports are failing and get them with pip)
 - Most important imports: **pandas, scikit-learn, scikit-neuralnetwork**

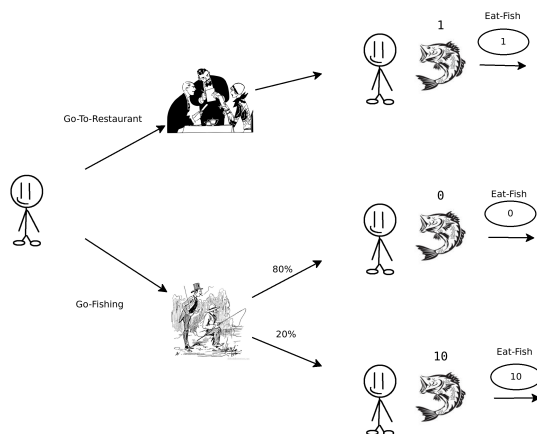

3 / 22

THE PROBLEM

- Let's assume you have access to real game logs, i.e. data generated through human game-plays
- Is it possible to replicate, even partially, the observed behaviour of players?
- Why would anyone want to do that?
 - Copy player behaviour and incorporate into NPCs (i.e., more "human-like choices").
 - Find optimal counter-strategies and incorporate into NPCs.
 - Bootstrap some other learning method.

4 / 22

FISHING TOON: PICTORIAL DEPICTION

5 / 22

EXPECTED REWARD

- In a sim like-game a player has to choose between two different actions
- Go-To-Restaurant or Go-Fishing

6 / 22

<div>IMITATING HUMAN PLAY: A BRIEF INTRODUCTION</div> <div>THE WORKSHOP</div> <h2>THE MARKOV DECISION PROCESS</h2> <ul style="list-style-type: none"> ▶ The primary abstraction we are going to work with is the Markov Decision Process (MDP) ▶ Very rarely made explicit, though always there implicitly ▶ MDPs capture the dynamics of a mini-world/universe/environment/game ▶ An MDP is defined as a tuple $\langle S, A, T, R, \gamma \rangle$ where: <ul style="list-style-type: none"> ▶ $S, s \in S$ is a set of states ▶ $A, a \in A$ is a set of actions ▶ $R : S \times A, R(s, a)$ is a function that maps state-actions to rewards ▶ $T : S \times S \times A$, with $T(s' s, a)$ being the probability of an agent landing from state s to state s' after taking a ▶ γ is a discount factor - the impact of time on rewards <div>7 / 22</div>	<div>IMITATING HUMAN PLAY: A BRIEF INTRODUCTION</div> <div>THE WORKSHOP</div> <h2>GOALS (A BIT MORE FORMALLY)</h2> <ul style="list-style-type: none"> ▶ Learn $\pi(s, a)$, a mapping between states and actions, called the <i>policy</i> ▶ Intuitively: “How should I act under this and this condition”? ▶ If we have logs from past games we can try to learn this mapping ▶ We have just restated our goal in more formal fashion - let's discuss a bit more <div>8 / 22</div>
<div>IMITATING HUMAN PLAY: A BRIEF INTRODUCTION</div> <div>THE WORKSHOP</div> <h2>REAL GAMES</h2> <ul style="list-style-type: none"> ▶ Real games often have a very large action and state spaces ▶ We can keep track of what players are doing ▶ ...but even for the simplest of cases learning a direct mapping is impossible ▶ Hence, the need to approximate (more on this later...) ▶ We will explore Linear Functions and Neural Networks in this workshop, but many more options are available <div>9 / 22</div>	<div>IMITATING HUMAN PLAY: A BRIEF INTRODUCTION</div> <div>THE WORKSHOP</div> <h2>INVERSE REINFORCEMENT LEARNING</h2> <ul style="list-style-type: none"> ▶ “Given that a player is acting optimally, can we copy her behaviour?” ▶ We are not going to cover this here, but it's worth discussing it ▶ Why does it even make sense? <ul style="list-style-type: none"> ▶ Is it more concise to learn R^* compared with π? ▶ Need for assumptions over the possible class of policies <div>10 / 22</div>
<div>IMITATING HUMAN PLAY: A BRIEF INTRODUCTION</div> <div>THE WORKSHOP</div> <h2>BEHAVIOURAL/SUPERVISED LEARNING</h2> <ul style="list-style-type: none"> ▶ Learn the sequences of actions using supervised learning ▶ Much simpler approach ▶ Obviously you have observed some sequence of $(s_0, a_1 \dots s_n, a_n)$ ▶ Learn a policy π from these actions directly ▶ This is what we are going to discuss in this workshop <div>11 / 22</div>	<div>IMITATING HUMAN PLAY: A BRIEF INTRODUCTION</div> <div>THE WORKSHOP</div> <h2>PREFERENCE LEARNING</h2> <ul style="list-style-type: none"> ▶ Supervised Learning ▶ One can learn to rank actions ▶ Is action a_0 better than action a_1 under state s? ▶ Multiple methods of doing this, not to be covered here <div>12 / 22</div>

<p>IMITATING HUMAN PLAY: A BRIEF INTRODUCTION</p> <p>THE WORKSHOP</p> <h2>REINFORCEMENT LEARNING</h2> <ul style="list-style-type: none"> ▶ Not covered <ul style="list-style-type: none"> ▶ ... but you can possibly treat action sequences as some kind of if implicit policy ▶ ... and try to learn a value function <ul style="list-style-type: none"> ▶ “What is the the average sum of expected rewards at state x?” ▶ With off-policy learning you might event attempt to learn a better policy than the one actually being executed! <ul style="list-style-type: none"> ▶ Search Q-Learning for more <p>13 / 22</p>	<p>IMITATING HUMAN PLAY: A BRIEF INTRODUCTION</p> <p>THE WORKSHOP</p> <h2>THE WORKSHOP</h2> <ul style="list-style-type: none"> ▶ Clone this repo: https://github.com/aigamedev/nuclai15 ▶ Run train.py ▶ Make sure you you can run everything ▶ We now essentially have a supervised learning problem <p>14 / 22</p>
<p>IMITATING HUMAN PLAY: A BRIEF INTRODUCTION</p> <p>THE WORKSHOP</p> <h2>THE DATA PIPELINE</h2> <ul style="list-style-type: none"> ▶ Define the problem ▶ Data collection ▶ Data munging ▶ Metric selection ▶ Algorithm selection ▶ Post-processing (not covered) ▶ Deployment (not covered) ▶ Experimental Evaluation (not covered) ▶ (Above according to Microsoft research) <p>15 / 22</p>	<p>IMITATING HUMAN PLAY: A BRIEF INTRODUCTION</p> <p>THE WORKSHOP</p> <h2>PROBLEM DEFINITION</h2> <ul style="list-style-type: none"> ▶ Everything we discussed until now ▶ ...find what the agent is going to go next ▶ Define 3 actions per axis ▶ Concentrate ONLY on movement, i.e. where am I going to move next? <ul style="list-style-type: none"> ▶ Re-create the Markov Property using 10 past (x,y) observations ▶ Use other player positions ▶ Let’s see some code <p>16 / 22</p>
<p>IMITATING HUMAN PLAY: A BRIEF INTRODUCTION</p> <p>THE WORKSHOP</p> <h2>DATA COLLECTION</h2> <ul style="list-style-type: none"> ▶ You will need some kind of in-game probe ▶ Sensors on a player ▶ Logs from some source ▶ For DOTA there are online matches <p>17 / 22</p>	<p>IMITATING HUMAN PLAY: A BRIEF INTRODUCTION</p> <p>THE WORKSHOP</p> <h2>DATA MUNGING (1)</h2> <ul style="list-style-type: none"> ▶ Key tools: Pandas, numpy, scipy ▶ Create CSV for further pre-processing ▶ <code>extract_data_vectors.py</code> ▶ You can run it, but it requires a game log .dem file <p>18 / 22</p>

METRIC SELECTION - ALGORITHM SELECTION

- ▶ Inside train.py
- ▶ Let's have a look
- ▶ Mean Squared Error is our selected metric - but it's not the optimal

19 / 22

FROM LINEAR REGRESSORS TO NEURAL NETWORKS

- ▶ Regressor in the form $y_w(\theta) = w_0\theta_0 + w_1\theta_1 + \dots + w_k\theta_k + b$
 - ▶ Equivalently $y_w(\theta) = \mathbf{w}\theta + \mathbf{b}$
 - ▶ Learn \mathbf{w}
- ▶ Nested $y_w(\theta) = \mathbf{w}^n(\max(0, \mathbf{w}^{n-1}(\max(0, \dots) + \mathbf{b}^{n-1})) + \mathbf{b}^n$
 - ▶ Learn \mathbf{w}

20 / 22

MODERN TRICKS OF THE TRADE

- ▶ Better initialisation methods (e.g., unsupervised pre-training, Glorot initialisation)
- ▶ Better training methods (e.g., ADAM, RMSPROP)
- ▶ Better activation functions/units (e.g., Rectifiers, Maxout)
- ▶ Better regularisation methods (e.g., Dropout)
- ▶ Better weight sharing/convolutional layers (e.g., Fractional Max-pooling)
- ▶ Better hardware (GPUs)
- ▶ **Most of these have equivalents in sklearn-neuralnetwork**

21 / 22

WORKSHOP TASKS

- ▶ Run experiments using a dummy classifier
- ▶ Run experiments using a Linear Classifier
- ▶ Run experiments using a Neural network
- ▶ Change the metric to "accuracy score"
- ▶ Each run should get you progressively better results
- ▶ Move some of the pre-processing to a different CSV file and load this (e.g., past examples)
- ▶ Change network architecture (e.g., number of neurons) and re-run the experiments
- ▶ Change train.py to save the classifier to a file (using python pickle)

22 / 22
